

AWS Hotstar Project - Errors, Solutions & Architecture

1. Common Errors Faced

Description	Solution
Launch template script broke due to incorrect multiline shell syntax or missing image name	Use single-line docker run or ensure correct syntax
ALB health check failed due to app not ready or wrong health path/port	Ensure /health returns 200 and add sleep in script
Security group/NACL or missing public IP	Allow port 22, assign public IP, check routing
Docker Hub authentication or wrong repository name	docker login and ensure correct image name
ASG using old version	Manually update ASG to latest launch template

2. AWS Architecture Diagram (High Level)

3. Flow Explanation

User → ALB → Target Group → EC2 (ASG) → Docker App (/health check)
EC2 in private subnet uses NAT Gateway for outbound internet access.
IGW enables inbound traffic routing for public resources.

4. Key Learning Summary

- Always validate Launch Template version in ASG
- Ensure Docker image exists and is publicly accessible
- ALB health check path must match application endpoint
- Cloud-init scripts must be syntax-safe (no broken multiline commands)
- Networking: Subnet + Route Table + IGW + NAT must align correctly
